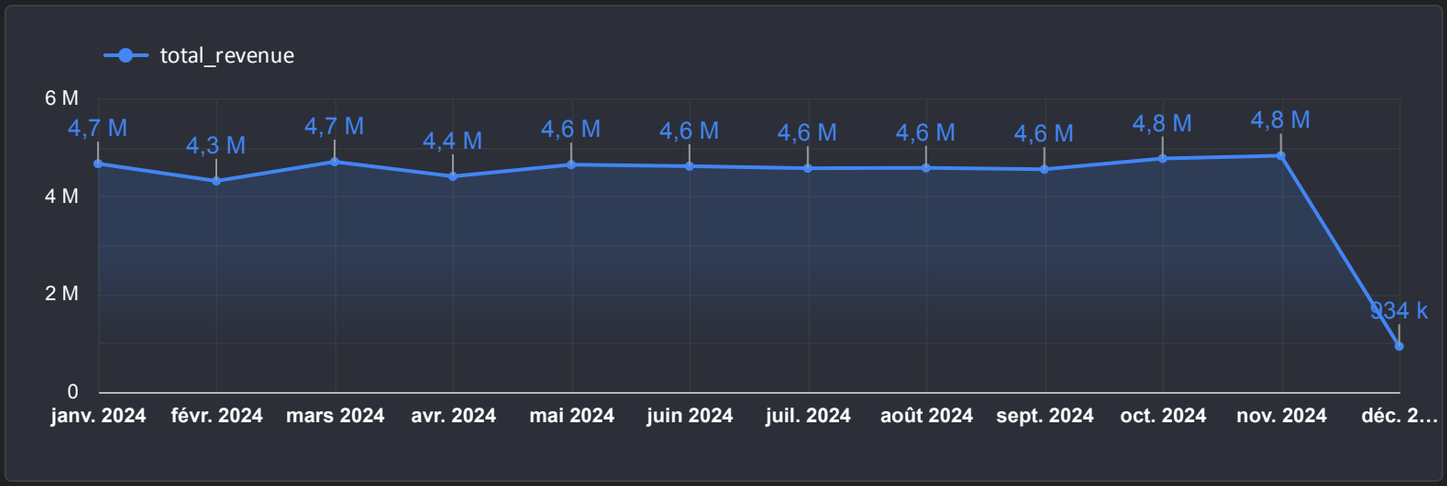
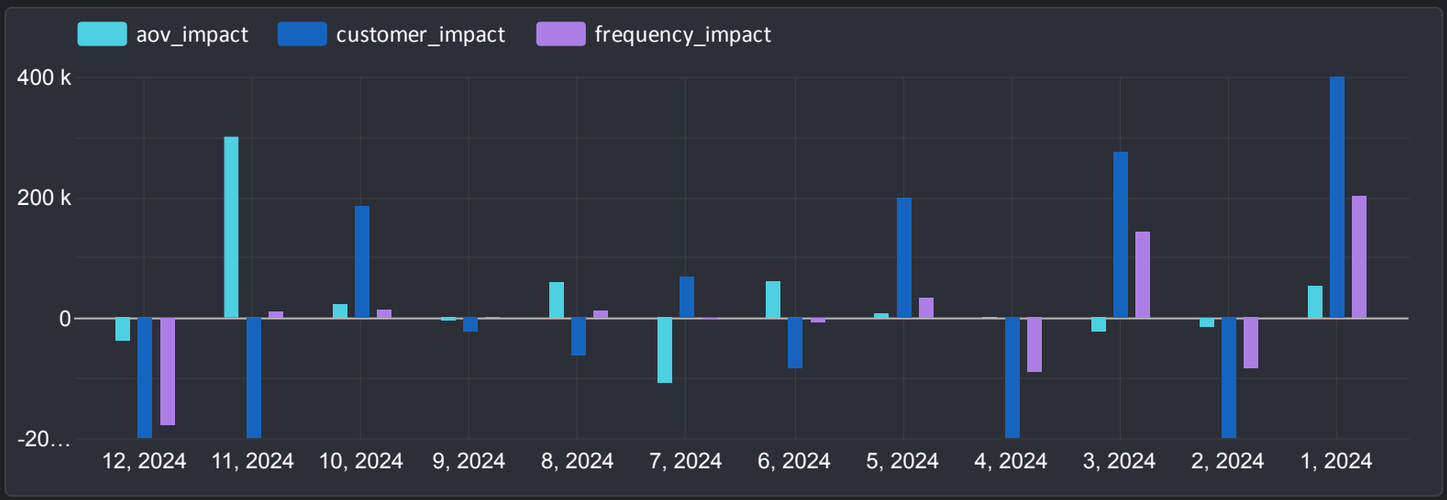
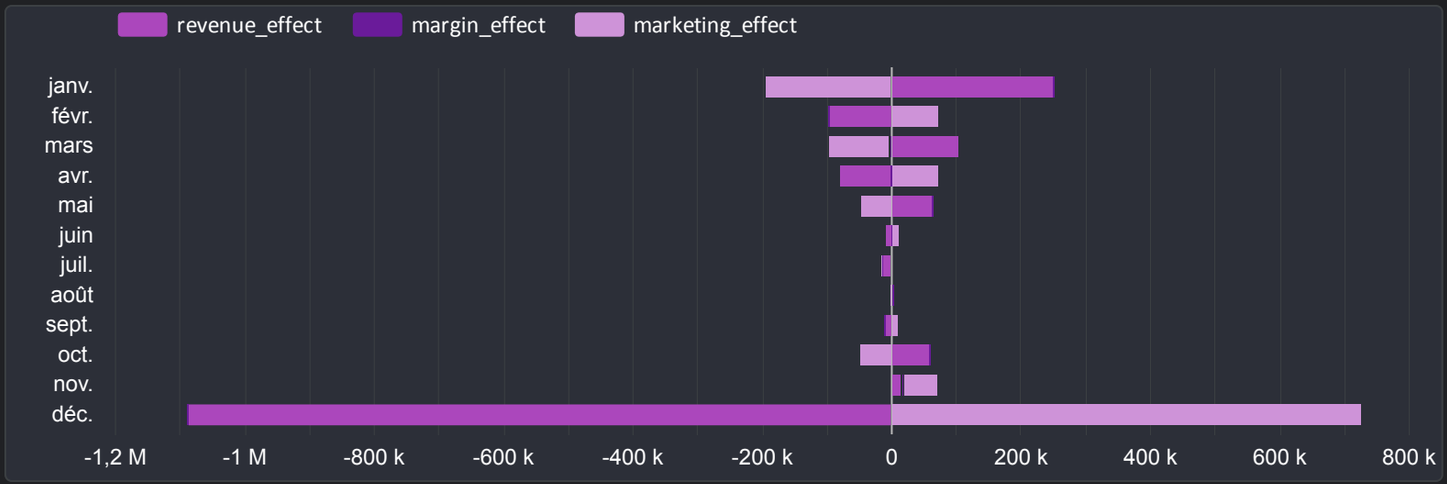
## Monthly Revenue Trend – 2024



## Revenue Drivers by Month

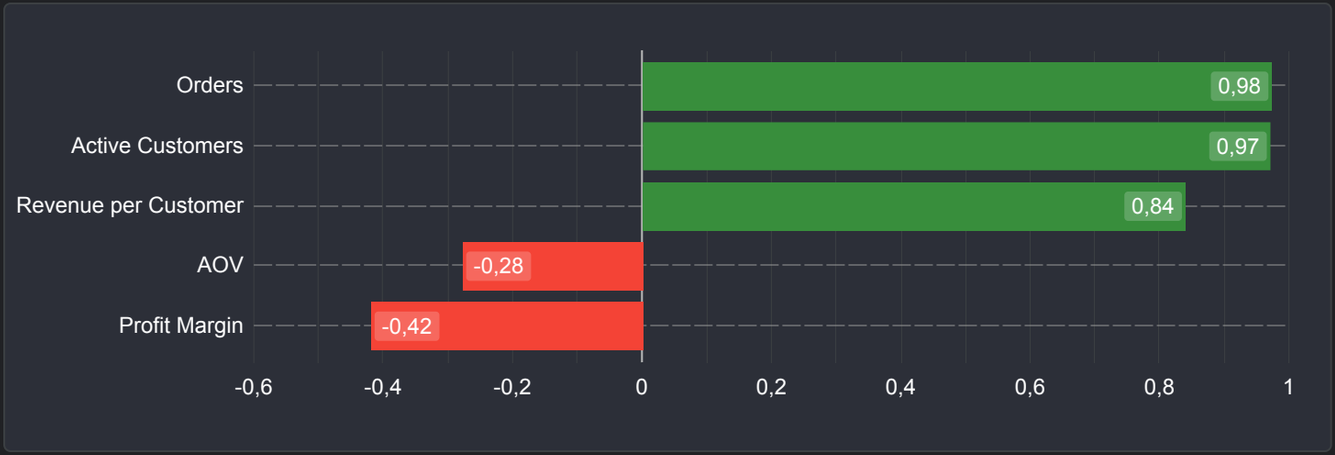


## Drivers of Profit Change



**Business Question: How does the business perform and what explains revenue changes in 2024 ?**

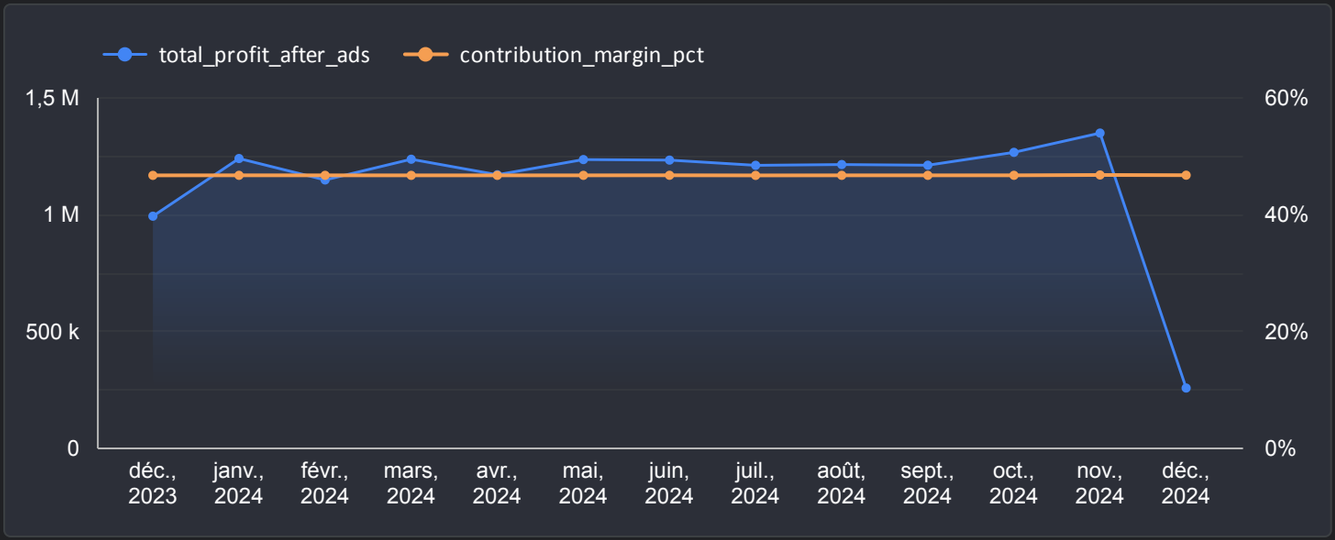
## Key Drivers of Revenue Change - Correlation Analysis



- Revenue is 98% correlated with Order Volume and Active Customers. This confirms a “Volume-First” business model. The primary growth lever remains expanding customer reach and purchase frequency.
- The negative correlation with AOV (-0.28) suggests that pushing for larger basket sizes is currently counter-productive. High-ticket items or “forced” upsells may lead to customer drop-off.
- The -0.42 correlation with Profit Margin is a critical signal. It indicates that our recent revenue growth is heavily dependent on promotional discounting or high acquisition costs.

since  we cannot easily raise prices without losing volume, I would suggest that we should protect margins by reducing internal costs (Logistics/COGS) and doubling down on Retention (Revenue per Customer) to lower our dependency on expensive new-customer acquisition

## Profit and Margin Trend



The contribution margin stays almost the same at about 46.6% every month, which means the company's pricing and cost structure are very stable. Because the margin does not change, the differences in revenue are mainly caused by changes in demand and order volume, not by pricing.

The large drop in December is therefore more likely due to incomplete data or a temporary drop in demand, rather than a problem with profitability.

Because the margin is stable (~46%), additional revenue generated through marketing will likely produce predictable contribution margins.
